

From MVP to MLP

Building Products People Love

Session Objectives

By the end of this session, you will:

- Understand what MVP and MLP mean and why they matter
- Learn how to define, build, and launch a real MVP
- Know when and how to evolve your MVP into an MLP
- See real examples
- Build your MVP action plan

If you had to launch tomorrow with **1** feature,
what would it be?

Google

Search Google or type a URL

**It's better to have a few things that work rather
than million things that don't.**

**In Product improving what you have is better than
creating add extra features.**

What is an MVP?

Minimum Viable Product

- Smallest thing you can build to test your core assumption.
- Not about launching, it's about LEARNING.
- Avoid over-building; focus on validation.

How do you get validation?

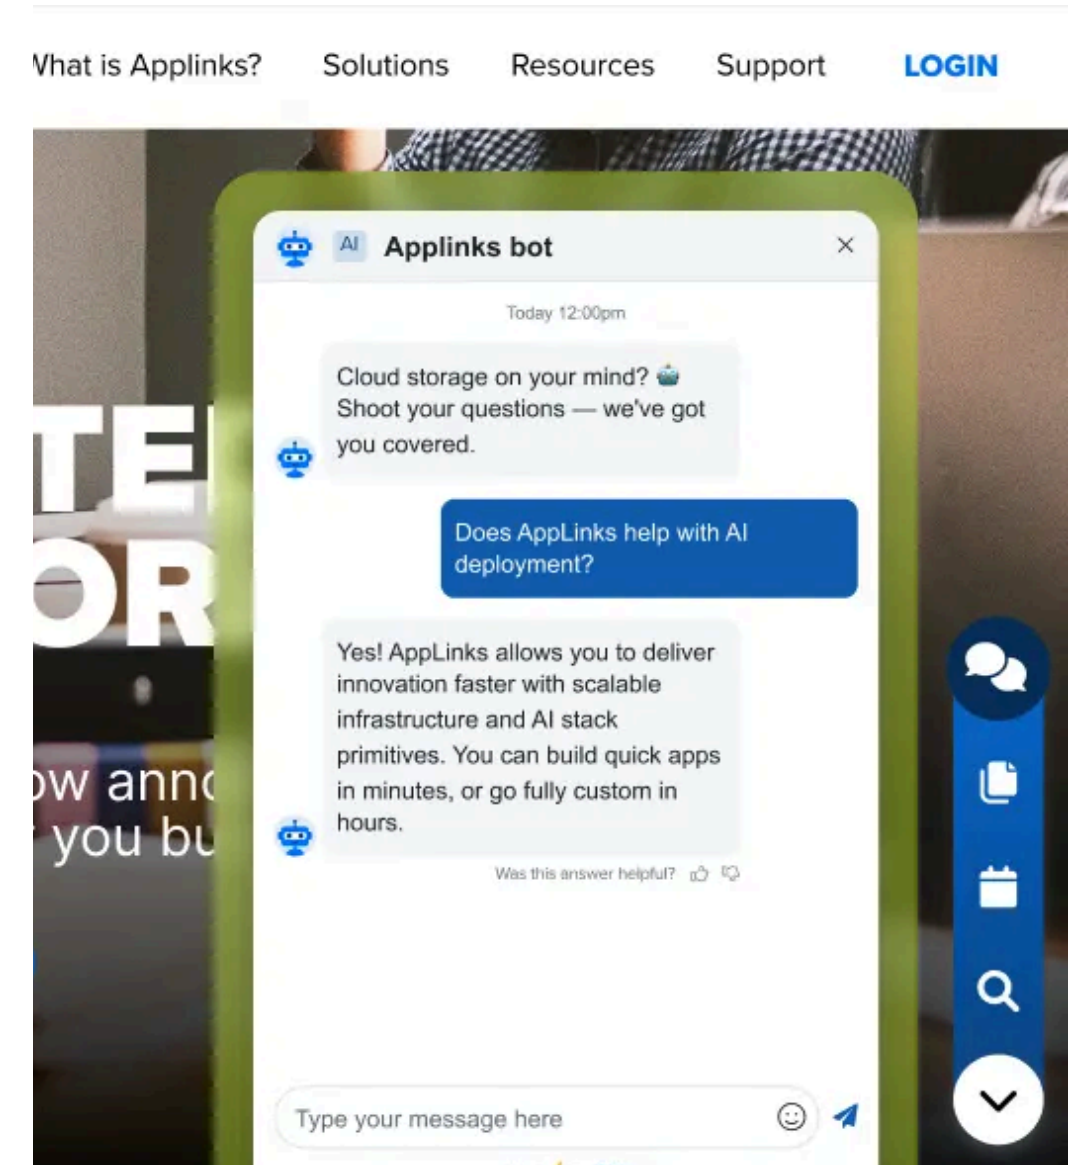

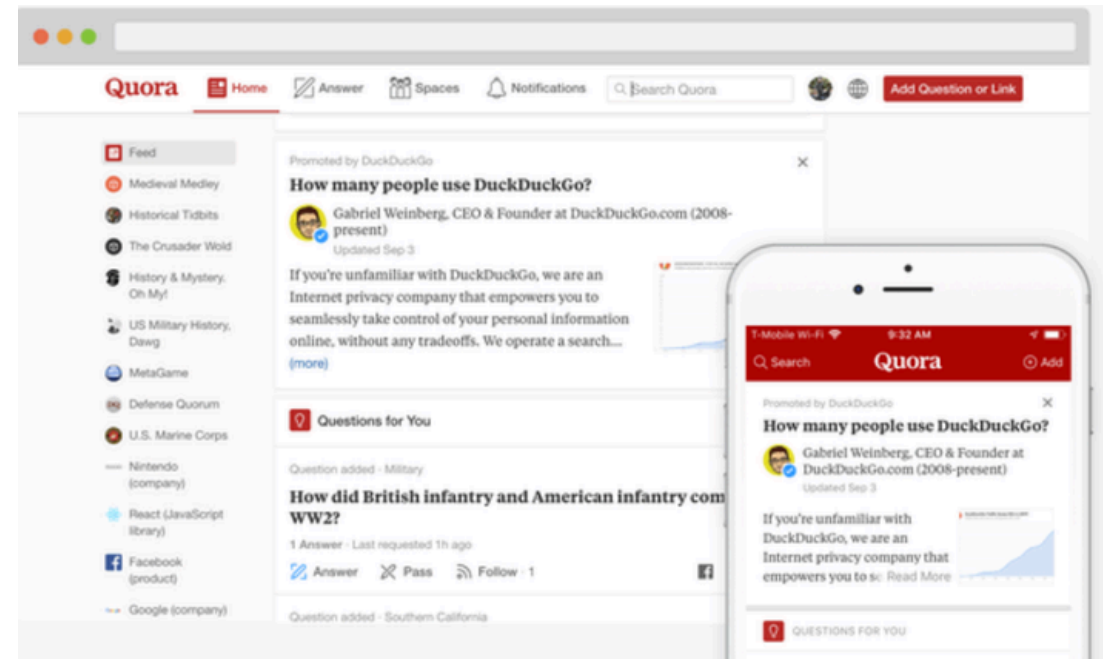

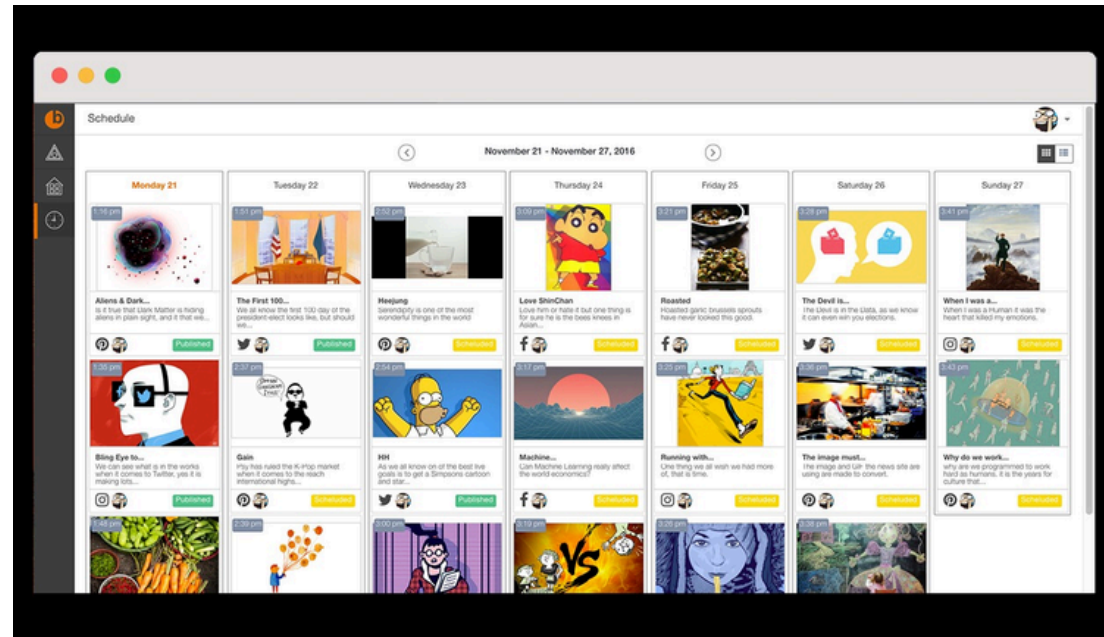

how do you know when something works?

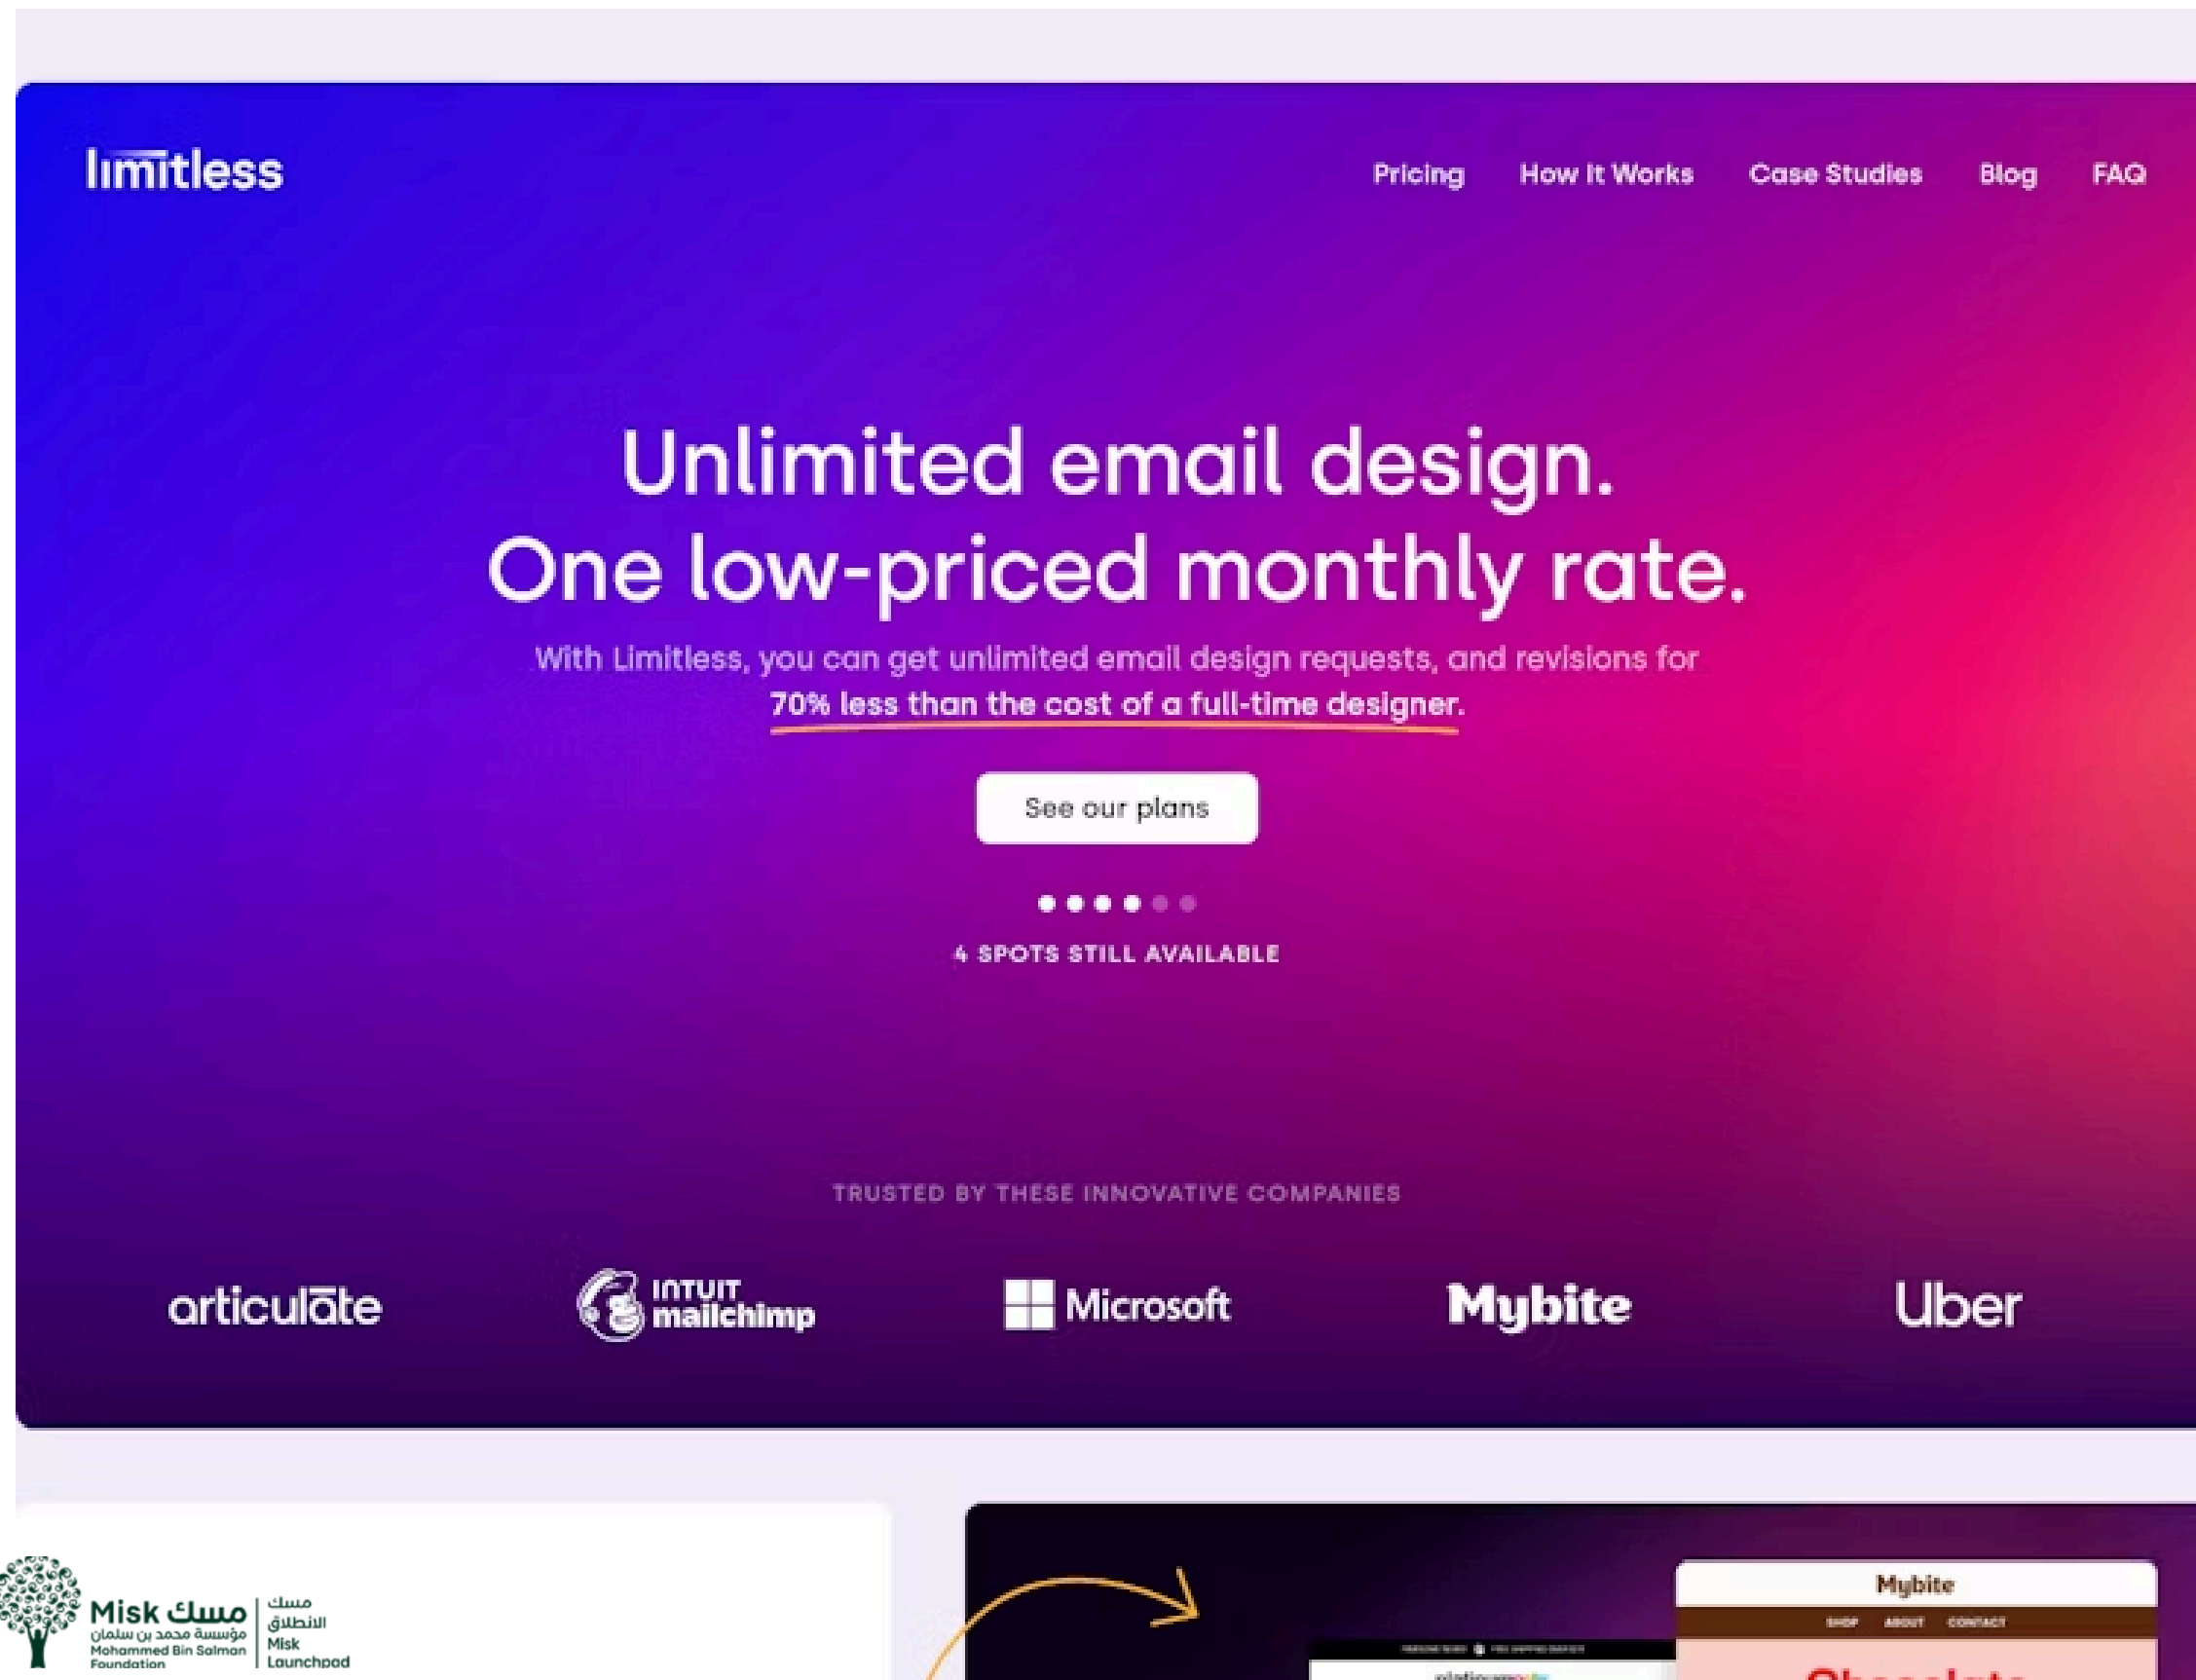

BLURBIZ

Quora

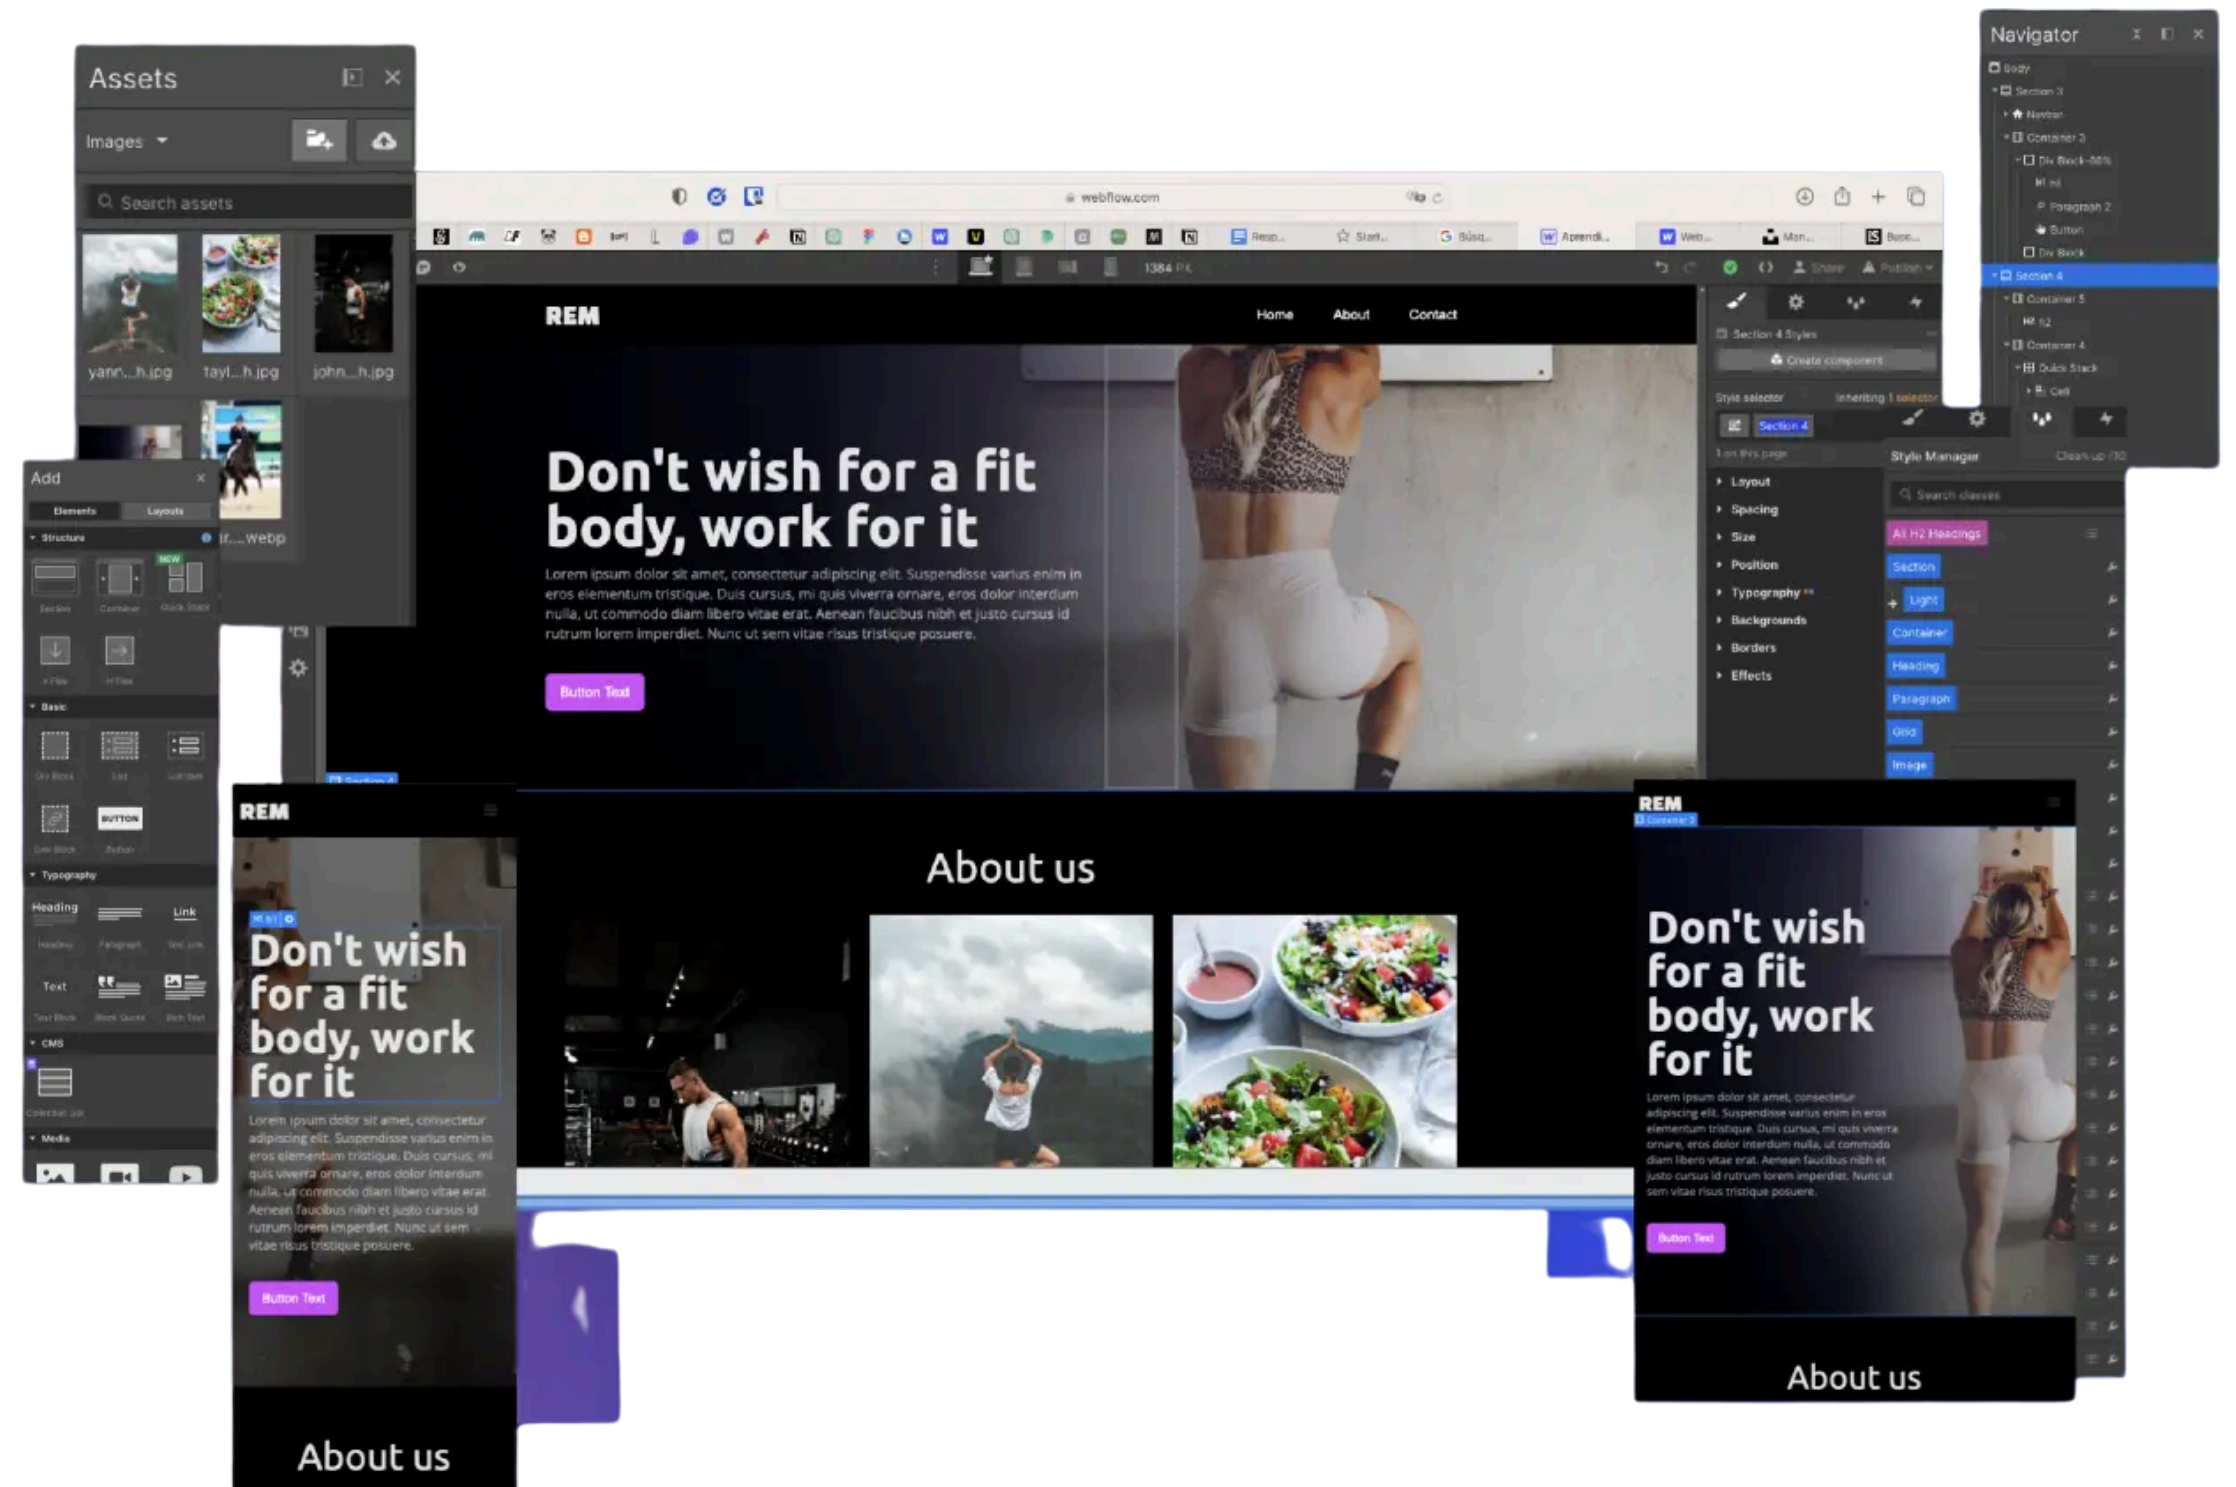

DRIFT

- Fake Logos
- Payments
- Refund

Great tool for creating Landing Pages

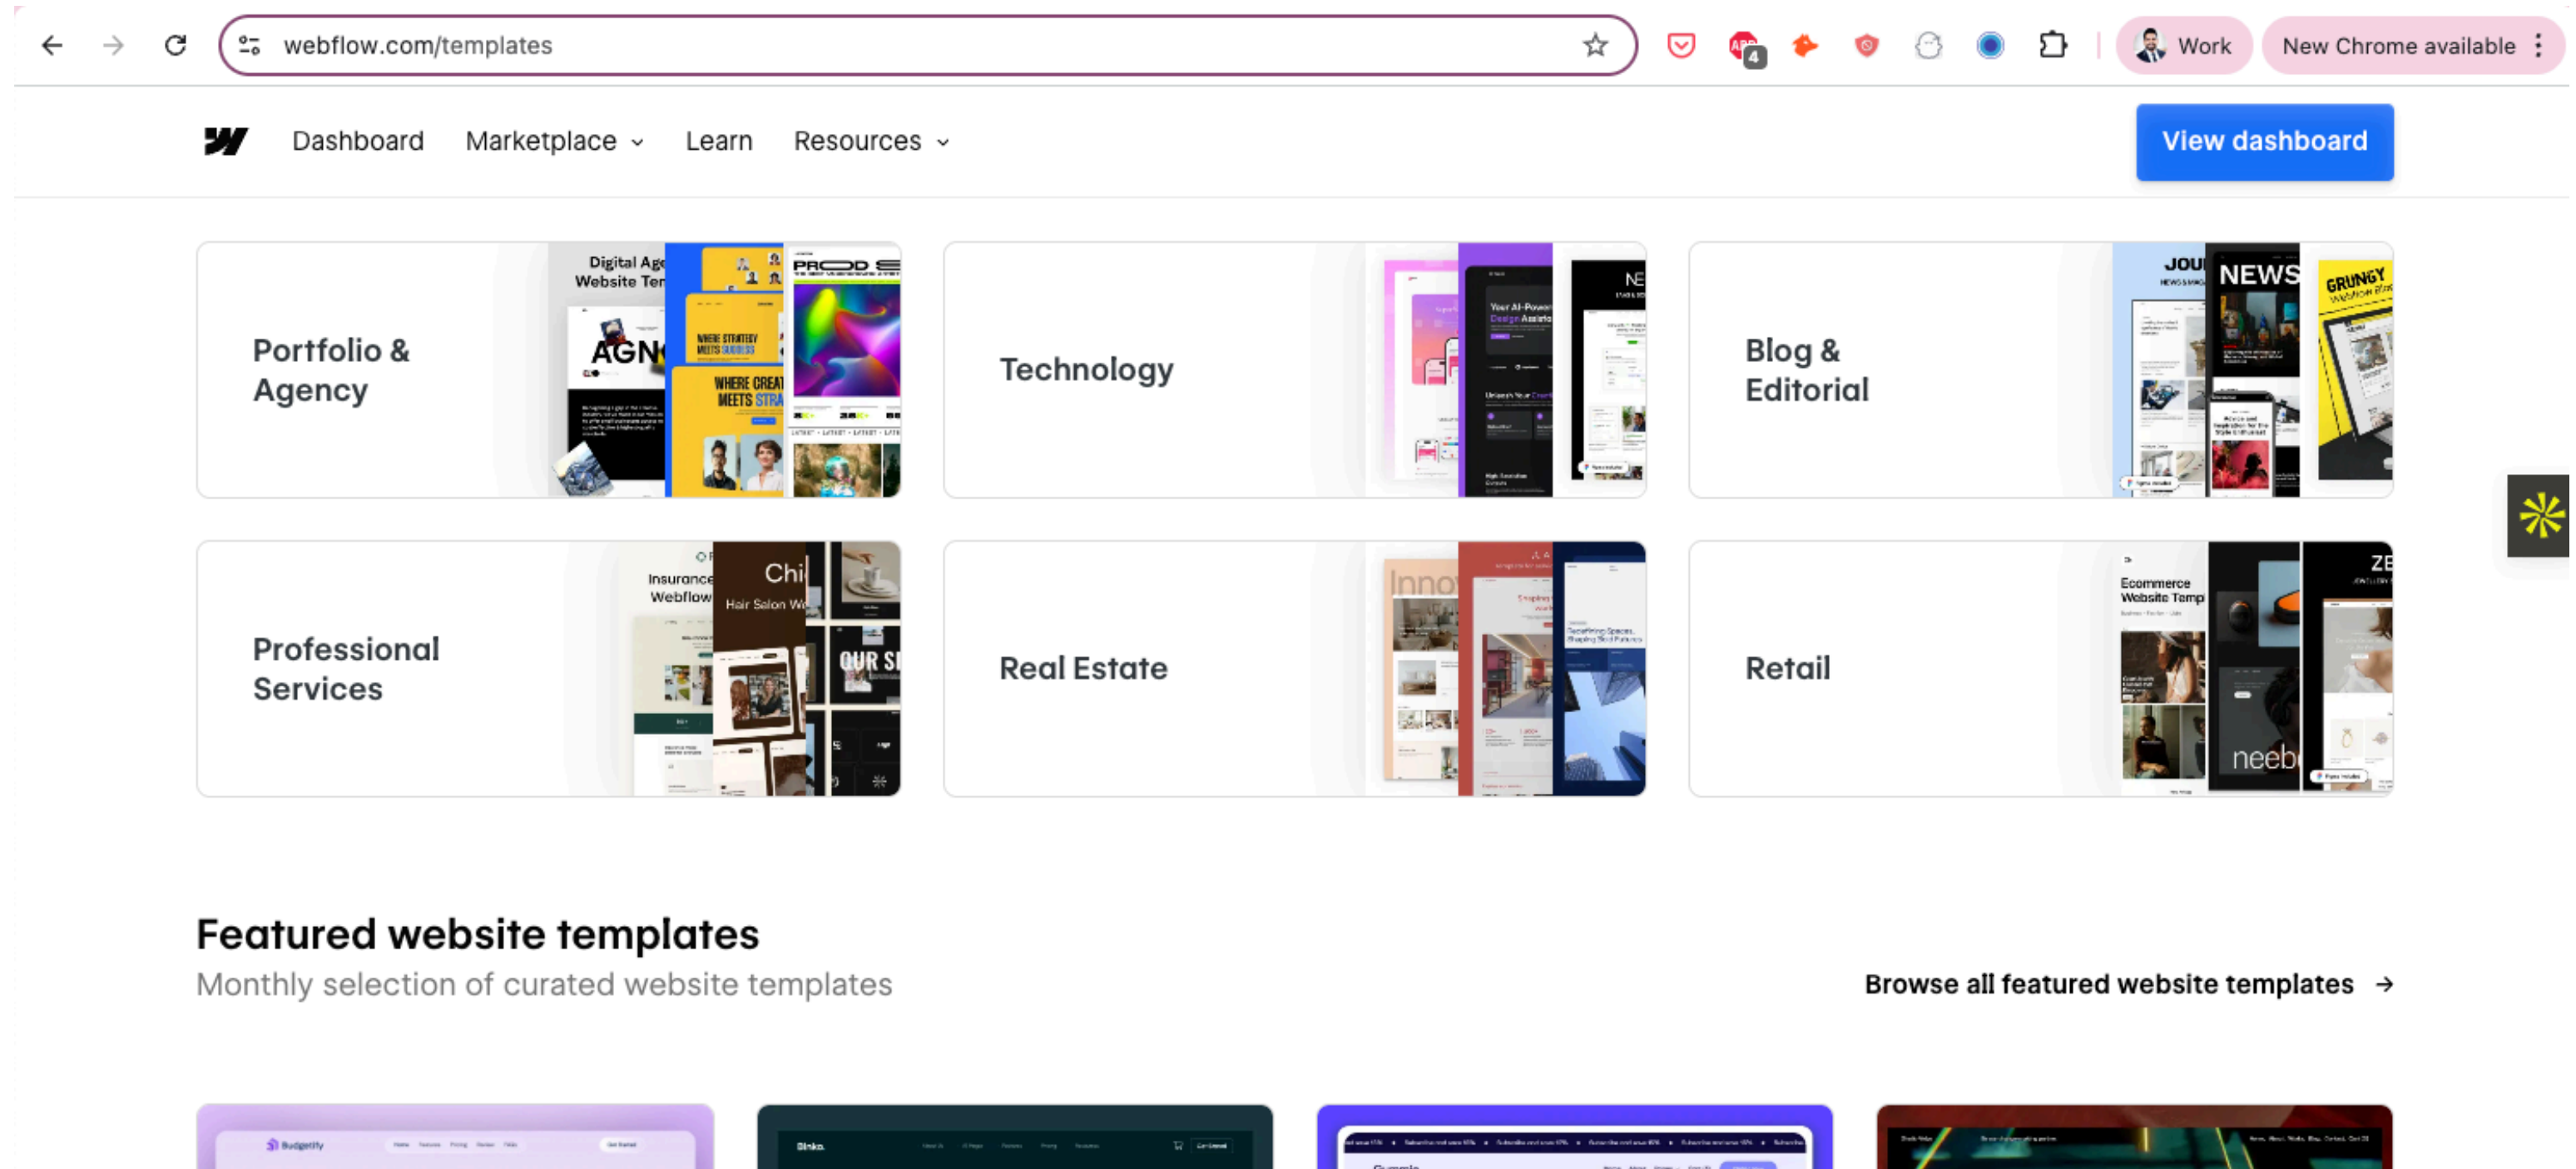

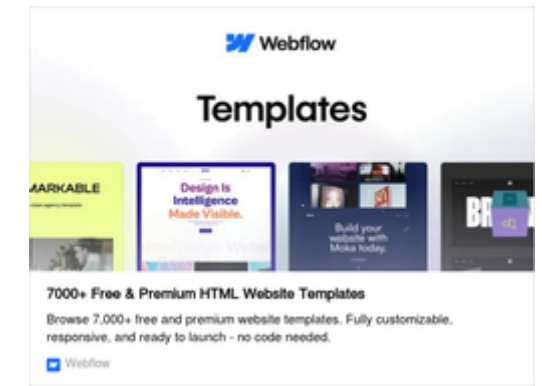

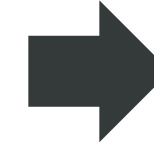

No Excuse

These Day there is no Excuse for

- Creating Bad Landing Pages.
- You are going to raise a Millions of Dollars You Need to Looking like Million Dollars.
- There are 1000 of Templates that you can use.

Common MVP Myths

- "It has to be perfect"
- "We need all features before testing"
- "Investors won't take us seriously without a full product"
- "It should look like our final product"

Truth: Your MVP should feel slightly embarrassing

Famous MVP Examples

- **Dropbox:** Explainer video (measured interest before building)
- **Zappos:** Founder manually bought shoes from stores
- **Airbnb:** Listed their own apartment with a few photos

B2B Space

Selling the product even before it is built, see if corporates are will to pay you up front to build the product.

That is how **Microsoft** did it.

Microsoft effectively pre-sold the operating system to IBM as part of their 1980 deal, but they also retained the rights to sell that same software to others.

Microsoft didn't actually have its own OS they licensed an existing one called 86-DOS from Seattle Computer Products.

Hardware

Oculus Rift Launched on Kickstarter with a basic prototype, raised \$2.4M from early adopters before a final product was built. Later acquired by Facebook for \$2B.

SUPERHUMAN

Ask your users how they'd feel if they could no longer use your product. The group that answers 'very disappointed' will unlock product-market fit.

Results

Superhuman around this single metric paid off. When we started this journey in the summer of 2017, our product-market fit score was 22%. After segmenting to focus on the very disappointed set of users, we were at 33%. Within just three quarters of our work to improve the product, the score nearly doubled to 58%.

ChatGPT

What is an MLP?

- Minimum Lovable Product
- Product that users LOVE, not just tolerate
- Adds delight, emotional connection, and loyalty
- Polished UI/UX, small details that surprise and delight

When to Move from MVP to MLP

- You have validated key assumptions
- Users are using it repeatedly
- Feedback = "This solves my problem"
- Ready to optimize experience and retention

MVP vs. MLP Comparison Table

	MVP	MLP
Goal	Validate assumptions	Build delight and loyalty
Timeline	Days to weeks	Weeks to months
Audience	Early testers / innovators	Early adopters / fans
Features	Core functionality only	Emotion-driven, delightful features
Design	Functional, simple	Polished, thoughtful
Success	Learn from usage & feedback	Retention, love, advocacy

The MVP Design Template

Use this framework:

- **Problem:** What pain point are you solving?
- **Hypothesis:** What do you believe will solve it?
- **Core User Action:** What should users do?
- **Fastest Test:** What's the simplest way to test?
- **Success Metric:** What will you measure?

Common Mistakes to Avoid

- Building too much
- Relying only on surveys (no behavior data)
- Ignoring feedback loops
- Failing to measure or track success

UX Testing

1. Get someone to use the product in front of you.
2. Encourage them to give open and honest feedback. 🧒
3. Ask them to perform a task (YOU CAN NOT TOUCH THE MOUSE, PHONE, KEYBOARD).
4. DO NOT SAY OR DO ANYTHING. 🙊
5. Watch in **Bliss** 😊 or **Extreme Agony** 😡 as they struggle to figure it out.

*You only need **4 - 5 test sessions** to figure it out.*

No-Code Tools to Build MVPs

- **Landing Pages:** Carrd, Webflow, Tally, Typeform
- **Prototypes:** Figma, Marvel
- **Apps:** Glide, Softr, Bubble
- **No Code:** Lovable, Base44, Replit
- **Analytics:** Mixpanel, Google Analytics, Hotjar

**There will always Be New Tools and
Products Pick what works for you.**

The Road from MVP → MLP

- **Day 1:** Build assumption test
- **Day 14:** Launch and collect data
- **Day 30:** Refine product experience
- **Day 100:** Add lovable layers

Final Thoughts

- Don't fall in love with your idea, fall in love with your user's problem
- MVP is about learning; MLP is about delight
- Move fast, test faster, iterate forever

Thank you!
