

Five decisions

Two of them revise advice you gave me. I would rather you push back today than after I submit.

Re-ID: must-have → should-have

The outcome stays must-have

Stable player identity in the report. Clubs rejected a competitor over it.

Automating it is should-have

That is cost and scale, not capability. We do it by hand in the pilot.

27%

of players missed by our detector — trained on 78 images. **883 of 1,802 identity breaks last 1–5 frames.** The bottleneck was never Re-ID. It was detection.

Four clubs. Three matches.

1 → 2

One match analysed is **two team reports**. Three matches — the 31 August rehearsal, then 12 and 18 October live — give us five reports across four clubs.

Al-Ittifaq U21, the anchor

Top of the table. Access through their analyst. Three reports — enough to show the development tier without selling it.

Three cold doors

Opened with a finished report, not a request for a meeting. Routes in through Misk and the Ministry. A club that declines is a finding too.

Kill number: fewer than 2 of 4 clubs ask for a second report, and none accepts any price, by 30 October → we stop.

Multi-match development tracking is the next tier — on the not-list, deliberately.

The tech was never the moat

Before LLMs, this pipeline took months to build.
Now models annotate it precisely, and soon they will track it.

What stays scarce is knowing **which metric matters** and **what a coach should do about it**.

A network, not a team

Computer vision · KAUST

Tactical modelling · Barça Innovation Hub

Sports science · next

We hold the club relationships, the deployment and the product.

A research consultancy in football — not a technology vendor.

Our pipeline is a public benchmark

Broadcast video → player positions and identities on a pitch. The field calls it **Game State Reconstruction**. It has a dataset, an open baseline and an annual competition.

Three things follow

Our hardest problem is a known hard problem, not our incompetence.

We can score ourselves against published research — ourselves, no permission needed.

KAUST is a partner in it, through their FIFA Research Institute.

Video-only, or into hardware?

Team-shape metrics — compactness, block height, pitch control — need this wide view. Broadcast never shows all 22.

Stay video-only

No friction, sell tomorrow — but limited to ball-local events, and a weak moat.

Either way it needs new detection and keypoint models. Their cameras pan, so already there's

Camera collaboration

Unlocks the whole team layer and puts us in the stadium — but capex, permissions, and Veo and Pixellot are

already there.
